

My New Tube - Full Error Fix and Change Report

Detailed Hinglish Team Document \(\Problem -> Root Cause -> Fix -> Impact\)

Scope: This report summarizes major fixes implemented from project customization start till current state.

Project ko YouTube-only banane ke saath humne stability, UI simplification, import reliability, release build safety, aur user-facing error UX pe focused fixes kiye.

Most critical wins: service isolation, non-YouTube import option removal, ZIP/CSV import fallback parsing, localization refresh correctness, and crash-noise reduction.

Main outcome: app now behaves more predictable for regular users, especially during extractor-side temporary failures.

Issue A: Subscriptions Import menu me SoundCloud option dikhta tha, click par crash risk

Problem: Import from menu me SoundCloud service aa raha tha, jabki app YouTube-only hai.

Root cause: menu build loop ServiceList.all\(\) use kar raha tha.

Fix: loop ko ServiceHelper.getSupportedServices\(\) pe switch kiya \(\already YouTube-only\).

Extra safety: unsupported service id aaye to safe fallback service id use hota hai.

CODE: for \(\service in ServiceHelper.getSupportedServices\(\)\) { ... }

CODE: val safeServiceId = if \(\serviceId in supportedServiceIds\) serviceId else supportedServiceIds.firstOrNull\(\) ?: serviceId

Files: app/src/main/java/org/schabi/newpipe/local/subscription/SubscriptionFragment.kt

Result: Import menu me SoundCloud option removed; click path YouTube-only safe.

Issue B: Subscription ZIP/CSV import unreliable tha

Problem: valid ZIP ya CSV file bhi kuch devices par fail hoti thi.

Root cause: parsing me single guessed MIME type use hota tha, SAF MIME inconsistency handle nahi hoti thi.

Fix: multi-MIME candidate + retry parser + partial-success import.

CODE: DEFAULT_MIME_CANDIDATES = application/zip, zip, text/csv, csv, application/json, json

CODE: parseSubscriptionsFromBytes\(...\) tries each MIME until success

CODE: Partial toast: Imported X subscriptions, skipped Y

Files: .../SubscriptionImportWorker.kt, .../values/strings.xml

Result: import flow significantly more resilient across file managers/devices.

Issue C: App me non-YouTube services ka leftover behavior

Problem: drawer/services/router/settings me legacy services remnants the.

Root cause: old multi-service architecture still active in some paths.

Fix set:

- ServiceHelper restricted to SUPPORTED_SERVICES = [YouTube].
- RouterActivity rejects non-YouTube URLs.
- Manifest deep links for Hooktube/Invidious/SoundCloud/PeerTube/Bandcamp/media.ccc removed.
- SelectKioskFragment now enumerates YouTube only.
- Migration v9 cleans non-YouTube tabs from stored tabs.

Files: ServiceHelper.kt, RouterActivity.java, AndroidManifest.xml, SelectKioskFragment.java, SettingMigrations.java

Result: service-layer behavior aligned with YouTube-only product direction.

Issue D: Drawer me unwanted complexity aur wrong options

Problem: drawer me extra options/services and UX confusion.

Fix set:

- Service switch/toggle interaction disabled in header.

- Drawer header service row visibility hidden.
- Trending drawer entry hidden by `shouldHideDrawerKiosk\("Trending")\`.
- Rate App and Share App actions added below settings section.
- Filled star icon added for rate app.

Files: `MainActivity.java`, `drawer_header.xml`, `values/strings.xml`, `drawable/ic_star_filled.xml`

Result: drawer cleaner, action-oriented, and YouTube-focused.

Issue E: Video detail controls mismatch \((Add To/Popup/Share/Download requirements)\)

Problem: requested controls order/visibility ke hisab se UI consistent nahi tha.

Fix set:

- Primary control row behavior adjusted; download path enabled directly.
- Background slot reused for share in requested layout customization.
- Description tab creation path removed from tab adapter flow.
- Default selected tab moved to related/next side where needed.

Files: `VideoDetailFragment.java`, `layout/fragment_video_detail.xml`

Result: controls now closer to requested simplified action model.

Issue F: Player top globe icon \((open in browser)\) hide request

Problem: player top controls me globe icon visible tha.

Fix: `openInBrowser` button ko hidden parent container me wrap kiya.

CODE: `<FrameLayout android:visibility='gone'> ... openInBrowser ... </FrameLayout>`

Files: `app/src/main/res/layout/player.xml`

Result: globe icon no longer appears in player controls.

Issue G: Settings pages ko hide/simplify karna tha without full removal in many cases

Approach: `Preference.setVisible\(false\)` based hiding used across fragments, so rollback easy rahe.

Covered sections:

- Video & Audio: extra player behavior/debug style options hidden.
- Download: advanced retry/network/queue/file-char options hidden.
- Appearance: non-essential toggles hidden.
- Content: feed and extra switches hidden as requested.

Files: `VideoAudioSettingsFragment.java`, `DownloadSettingsFragment.java`,

`AppearanceSettingsFragment.java`, `ContentSettingsFragment.java`

Result: settings UX cleaner and lower-risk for end users.

Issue H: Main settings me Notifications, Updates, Backup/Restore remove request

Fix set: entries removed from `main_settings.xml` and registry mappings removed.

Related module removals: update checker worker/settings and notification settings xml fragments deleted.

Files: `main_settings.xml`, `SettingsResourceRegistry.java`, `UpdateSettingsFragment.java` \((deleted)\), `NewVersionWorker.kt` \((deleted)\), `notifications/backup xml files` \((deleted)\)

Result: user-facing settings surface strictly reduced to required categories.

Issue I: Trending content country/language change immediately reflect nahi ho raha tha

Problem: content settings change ke baad kiosk content stale lag raha tha.

Root cause: localization and cache refresh not applied consistently on resume/change.

Fix set:

- `ContentSettingsFragment` now applies localization on language/country preference change.
- `InfoCache` clear + `PlayerHelper.resetFormat` called after localization update.
- `KioskFragment` now tracks country + language; if changed, re-setup localization + clear cache + reload.

Files: `ContentSettingsFragment.java`, `KioskFragment.java`

Result: trending/music/live feeds respond better to selected content region/language.

Issue J: Parsing error snackbar/report UX too technical

Problem: users ko technical error screen/log clutter dikh raha tha, trust impact hota tha.

Fix set:

- ErrorActivity me parsing_error case detect karke friendly message mode enabled.
- Headline and message text size increased for readability.
- Technical report controls hidden in friendly mode.
- Non-fatal extractor-only errors in stream/player paths suppressed where primary data exists.

Files: ErrorActivity.kt, activity_error.xml, values/strings.xml, VideoDetailFragment.java, Player.java, FeedFragment.kt

Result: users get clearer message, less panic, less noisy false-critical reporting.

Issue K: Keep Android Open dialog removal

Problem: startup par unwanted policy dialog dikh raha tha.

Fix direction: update-check and related consent/popup flow removed from active path.

Files: MainActivity.java updates + removal of update utility stack

Result: dialog no longer appears in regular flow.

Issue L: Release-only build requirement, debug APK not wanted

Problem: workflow needed run/install through release path only.

Fix set:

- Release signing config added via gradle/env/keystore.properties lookup.
- Release signing missing ho to fail-fast GradleException.
- Debug variants disabled in androidComponents.
- keystore.properties.example added for team setup consistency.

Files: app/build.gradle.kts, keystore.properties.example

Result: release pipeline strict and controlled, accidental debug build reduced.

Issue M: String encoding artifact risk

Problem: image_quality_summary me corrupted dash style text artifact visible tha.

Fix: safe ASCII hyphen style summary text applied.

Files: app/src/main/res/values/strings.xml (image_quality_summary)

Result: stable render and lower chances of malformed display.

- Subscriptions -> Import from menu me sirf expected YouTube options dikhen.
- Import flow ZIP + CSV both test karo; partial failure case me skip count confirm karo.
- Drawer me Rate App + Share App working verify karo.
- Player top controls me globe icon visible na ho.
- Content country/language change ke turant baad kiosk reload behavior verify karo.
- Parsing error scenario me friendly message screen and larger text confirm karo.
- Release build signing config check + debug variant disabled validation.

Is report ka goal transparency hai: exactly kya issue tha, kyu hua, aur code me kis level par fix kiya gaya. Future maintenance me isi template ka reuse recommended hai.

Recommended process going forward: Every production bug fix = mini section with Problem, Root Cause, Fix, Files, QA proof.
